

## Identifying your Winkhaus Multipoint Door Lock

### Step by step guide to identifying a Multipoint Door Lock

**1** - Open the door and look for a name printed into the metal plate running down the side of the door. The printed name is the brand of multipoint lock.

**2** - If there isn't a name or letters on the strip then remove the multipoint lock from the door. With the lock removed, note the shape of the central body of the lock and match its shape with the photos of our door locks until you find a match.

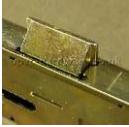

Comparing the above to photos on our [Multipoint Lock page](#), you can see that this one is a Mila lock.

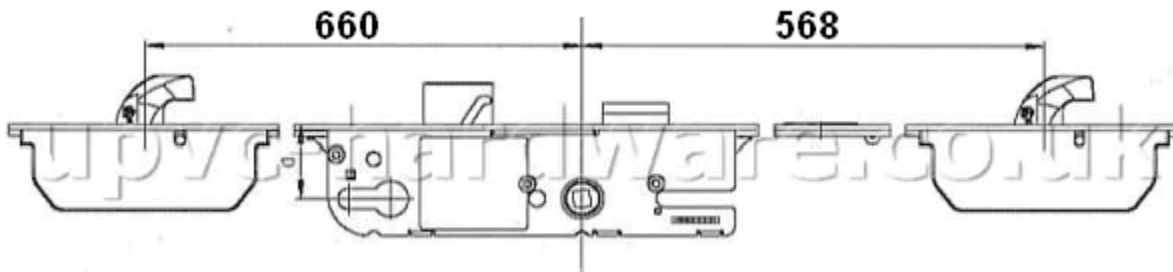

**3** - Now that you have identified the brand you need to identify the locking points along the metal strip. The picture below shows the different types of locking points.

Types of Locking Point: (note that many locks have more than one type)

-   
**Hook**
-   
**Deadbolt**
-   
**Roller Cam**
-   
**Mushroom Cam**

-  Finger Bolt
-  Centre Latch
-  Anti Lift Pin & Hook

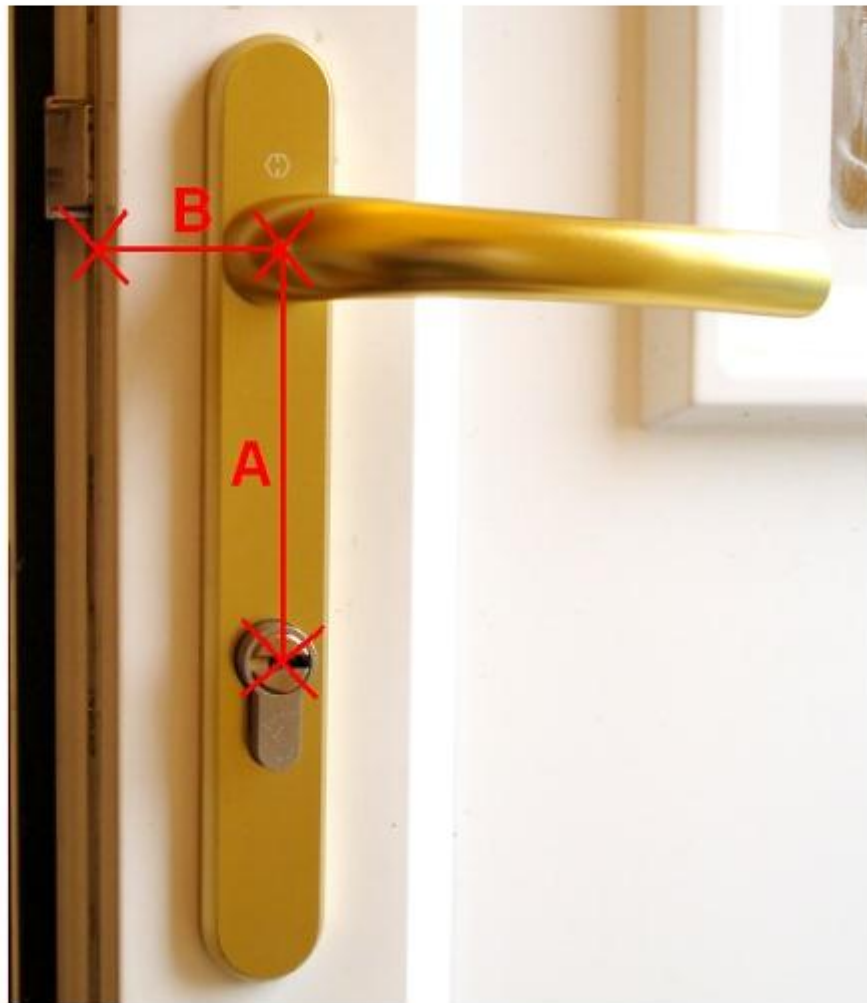

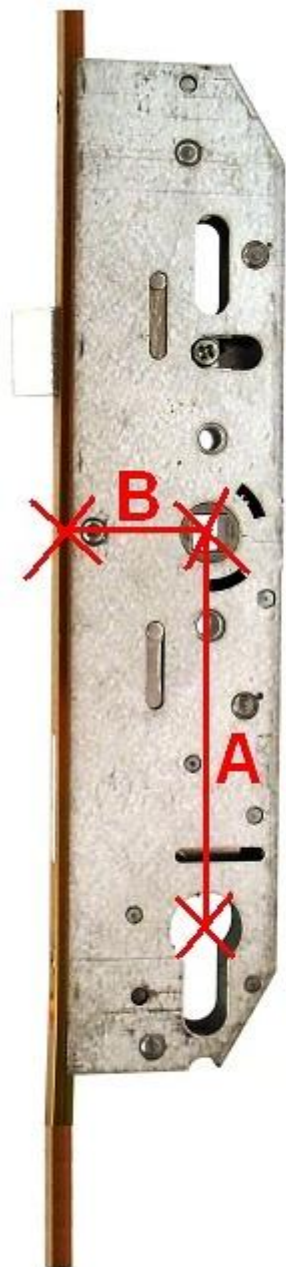

**4** - If there are hooks or deadbolts top and bottom then you need to measure the distance between them in millimetres (see technical drawing below). You can then compare that measurement to the measurements given for each door lock.

**5** - Check the spindle to key measurement (Dimension **A**).

**Left: Measuring 'A' & 'B' with the multipoint lock removed from the door.**

**Below: Measuring 'A' & 'B' with the multipoint lock still in the door.**

**6 - Check the backset measurement (Dimension B).**
